

Top Quadrant

This is an exciting time for TopQuadrant. Our customers are solving key business challenges by deploying a range of solutions that address business vocabulary use and management.

At the Semantic Technology Conference in 2009, TopQuadrant introduced its TopBraid Enterprise Vocabulary Management Solution (EVMS). We continue to enhance EVMS in areas such as governance while now also supporting solutions for data exchange and XML Schema generation to help customers deploy business applications in multiple industries.

We are pleased to announce that collaboration between TopQuadrant and Netherlands Ministry of Justice (MoJ) has resulted in a semantic model-driven Metadata Workbench. Showcased in a recent webinar (recording available), it embodies a new approach to the design of XML messages and generation of XML Schemas based on the UN/CEFACT Core Component Technical Specification (CCTS). The Metadata Workbench makes possible the collaborative design of semantically unambiguous messages for data exchanges within and between organizations. The solution provides support for local context and variations while remaining compliant with standards.

The MoJ Metadata Workbench solution will be available soon under an open source license. Visit our exhibit at SemTech 2010 or contact us to find out more and see demos of the extended EVMS and Metadata Workbench solutions.
